# Content Integrator

## Empower Enterprise Content with One Solution

Systemware Content Integrator (CI) is a platform for developing content centric applications. The built-in features provide users the ability to capture, organize, find, transform, interact, route and dispose of content as well as content metadata.

The CI Capture Service collects content from a variety of sources including local or remote disc drives, email folders or inboxes, message queues, and others. The Capture Service can also integrate with external or 3rd party applications to extend its functionality.

The powerful Topic Mapping Engine in CI allows content metadata to be organized to maximize fast, efficient, secure access to relevant business information. The same content metadata can be "mapped" to different topics to ensure that actionable information is provided to the right user at the right time.

CI's Content Retrieval Service provides the ability to configure how content is delivered when it is requested. The CRS supports adding backer/fronter pages, deterministic transformation based on the current state of the content, or combining content related to the requested content.

With a built-in BPM engine, CI is capable of providing complex content workflow processes. From the simplest 2-stage approval process to multi-phase, multi-user processes, CI BPM is flexible and extensible enough to meet the business need.

The retention processing capabilities provided by CI support disposing of content and/or content metadata at the right time, no sooner, no later. Disposition can be configured based on time, events, or a combination thereof.

On top of all of this functionality is a powerful yet simple XML API that provides integration in all environments or, combined with the Flextop UI, the power of CI is exposed via a web user interface with a GUI designer that allows an administrator to provide the interface that will empower his users to get business done.

## Key Features

- ▶ Provides a powerful yet simple XML API which easily integrates with applications, systems and additional content repository across the enterprise
- ▶ Expands the ability to capture and use enterprise information across applications
- ▶ Offers unlimited flexibility in delivering content to workflows, processes and users
- ▶ Automatically transforms content into an usable format by other systems or users

## System Requirements

### Systemware Content Server

**Operating system** - AIX 5.3+, Linux Redhat 7.0+, Sun Solaris 8+, Windows, z/OS

**Java 2 SDK 1.5+**

## Optional Requirements

**Java EE Application Server** - Apache Tomcat 5.5+, IBM WebSphere Application Server 6+, BEA WebLogic Server 8.1+, Java 2 SDK 1.4.2

**Relational Database** - Microsoft SQL Server 7+, IBM DB2 8+, Oracle 8i, Oracle 9i, or Oracle 10g
